

AMENDMENTS TO THE CLAIMS

1. (Cancelled) .

2. (Currently Amended) An accessory according to claim ± 10, characterized in that the direction of the output shaft is substantially perpendicular to the rotary axis of the roller.

3. (Currently Amended) An accessory according to claim ± 10, characterized in that the transmission includes a first toothed wheel which is rigidly attached to the input shaft and which cooperates with a toothed belt.

4. (Currently Amended) An accessory according to claim ± 10, characterized in that the transmission includes a second toothed wheel which is rotatably mounted in the fork-shaped unit and which cooperates with a toothed belt.

5. (Original) An accessory according to claim 4, characterized in that the second toothed wheel is rigidly attached to a driving shaft which is rotatably mounted in the fork-shaped unit and which in its end projecting towards the center of the fork-shaped unit is mechanically coupled to the roller for transferring the rotation of the driving shaft to the roller.

6. (Original) An accessory according to claim 4, characterized in that the second toothed wheel is mounted in a first leg of the fork-shaped unit and that an opposite second leg of the fork-shaped unit is significantly thinner than the first leg, whereby in the rotation of the roller the roller can be placed close to a side wall.

7. (Currently Amended) An accessory according to claim ‡ 10, characterized by a prolongation unit including a first end having a mounting part similar to the mounting part of the fork-shaped unit and an opposite second end similar to the output side of a driving machine for which the accessory is intended, and an intermediate shaft between the first and second ends.

8. (Currently Amended) An accessory according to claim ‡ 10, characterized in that the working surface of the roller is ~~the a~~ surface of a working cloth which is detachably mounted to ~~the an~~ envelope surface of the roller.

9. (Currently Amended) An accessory according to claim 8, characterized in that the working cloth has the shape of a strip helically wound around the envelope surface of the roller and

having lateral edges of adjacent coils of the strip placed at in contact with each other.

10. (New) An accessory for a power tool, said tool having an output shaft and a surface, the accessory comprising:

a mounting part for mounting to said surface;

an input shaft contained in said mounting part for coupling with said output shaft;

a transmission connected to said input shaft for transferring movement of the output shaft to drive said accessory;

a fork-shaped unit having two legs on opposite sides and containing said transmission;

a roller having a working surface having opposite ends mounted in opposite legs of said fork-shaped unit and connected to said transmission for receiving power therefrom.
